

Sprint 3 Documentation

Sprint Number: Sprint 3

Sprint Duration: 2 Weeks

Sprint Focus: Course Enrollment and Lesson Page Structure

1. Sprint Objective

The objective of Sprint 3 was to make the course system functional. This included allowing users to enroll in courses, continue enrolled courses, drop courses, and access structured lesson pages.

2. Sprint Scope

The sprint scope included course enrollment logic, enrolled course management, lesson page routing, and the first structure of course lesson content. This sprint helped transform the application from a basic dashboard into a learning platform.

3. Functional Requirements

Users should be able to enroll in available courses.

Users should be able to view enrolled courses on the dashboard.

Users should be able to continue a course after enrolling.

Users should be able to drop a course.

Users should be able to open a course lesson page.

Lesson pages should include structured learning sections.

Each lesson should support vocabulary, key sentences, dialogue, listening, speaking, and quiz content.

4. System Design Activities

The course enrollment flow was designed during this sprint. The system needed to know whether a user was enrolled in a course and update the dashboard based on that status.

The lesson page design was also planned. A shared lesson page structure was created so that different languages and lessons could use the same layout instead of creating separate pages for every lesson manually.

5. Implementation Work Completed

Course enrollment functionality was added.

Continue course functionality was added.

Drop course functionality was added.

Dashboard course cards were updated.

Course routes were connected to lesson pages.

Initial lesson page layout was created.

Lesson sections were organized into a reusable structure.

6. Testing Activities

The team tested course enrollment by enrolling in a course and checking whether the dashboard updated correctly. The continue and drop features were also tested. Lesson routes were tested to make sure users could navigate from the dashboard to the correct lesson page.

7. Challenges

One challenge was managing course state correctly so that the dashboard showed the correct button depending on whether a user was enrolled or not.

Another challenge was planning the lesson structure in a reusable way. Since the platform needed to support many languages and lessons, the team had to avoid creating repeated code for every course.

8. Sprint Deliverables

Course enrollment feature.

Continue course feature.

Drop course feature.

Updated dashboard course cards.

Lesson page routing.

Reusable lesson page structure.

Initial lesson content sections.

9. Sprint Review

Sprint 3 successfully added the main learning flow of the application. Users could now interact with courses and access lesson pages. This was a major step because the platform became more than just a dashboard and started functioning as a real learning system.

10. Sprint Retrospective

Sprint 3 showed the importance of reusable components. Since the project included multiple languages and many lessons, reusable lesson structures helped reduce duplicate code and made the system easier to maintain.
