

Sprint 4 Documentation

Sprint Number: Sprint 4

Sprint Duration: 2 Weeks

Sprint Focus: Progress Tracking and UI Improvements

1. Sprint Objective

The objective of Sprint 4 was to improve the accuracy of course progress tracking and simplify the enrolled course card user interface. This sprint focused on making the application more reliable and easier to use.

2. Sprint Scope

The scope of this sprint included progress calculation, dashboard cleanup, enrolled course card improvements, and user experience updates. The team worked on removing unstable progress behavior and replacing it with saved lesson-based progress logic.

3. Functional Requirements

Course progress should be based on saved lesson data.

Progress should not randomly change after refreshing the page.

Progress should reflect actual completed lessons or sections.

Enrolled course cards should be clean and easy to read.

Unnecessary progress lines and percentage text should be removed.

Course cards should still show important course information and action buttons.

4. System Design Activities

The team reviewed how progress was being calculated and identified that random or temporary values were not reliable. A new design was planned where progress would be calculated from saved lesson progress keys or completed lesson data.

The dashboard card design was also reviewed. The team decided to simplify the card layout so users could focus on the course name and main actions without too much visual noise.

5. Implementation Work Completed

Progress logic was updated.

Random progress values were removed.

Progress was connected to saved lesson data.

Enrolled course cards were simplified.

Progress bars were removed from enrolled cards.

Progress percentage text was removed from enrolled cards.

Dashboard UI spacing and readability were improved.

6. Testing Activities

The team tested whether progress stayed consistent after page refreshes and re-renders. Course cards were also tested to make sure they still showed the correct course information and action buttons after the UI changes.

7. Challenges

One challenge was making progress tracking stable without overcomplicating the system. The team needed progress to be accurate while still keeping the logic simple and maintainable.

Another challenge was improving the dashboard design without removing useful information from the user.

8. Sprint Deliverables

Stable course progress logic.

Saved lesson-based progress calculation.

Cleaner enrolled course cards.

Removed progress bars and percentages.

Improved dashboard user experience.

Updated UI behavior.

9. Sprint Review

Sprint 4 successfully improved the reliability and usability of the application. Progress tracking became more meaningful, and the dashboard became cleaner and easier to use.

10. Sprint Retrospective

Sprint 4 showed that small UI and logic improvements can make a large difference in user experience. The team learned that features should not only work, but they should also be stable, predictable, and easy for users to understand.
